Common Weakness Enumeration

A Community-Developed List of Software & Hardware Weakness Types

1425 - Weaknesses in the 2023 CWE Top 25 Most Dangerous Software Weaknesses

- . B Out-of-bounds Write - (787) #1
- . B Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') -
- . B Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') -
- . V Use After Free - (416)
- . B Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') -
- . C Improper Input Validation - (20)
- . B Out-of-bounds Read - (125)
- . B Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') - (22)
- . B Cross-Site Request Forgery (CSRF) - (352)
- . B Unrestricted Upload of File with Dangerous Type - (434)
- . C Missing Authorization - (862)
- . B NULL Pointer Dereference - (476)
- . C Improper Authentication - (287)
- . B Integer Overflow or Wraparound - (190)

CWE-787: Out-of-bounds Write

Weakness ID: 787

Abstraction: Base

Structure: Simple

View customized information:

Conceptual

Operational

Mapping
Friendly

Complete

Custom

▼ Description

The product writes data past the end, or before the beginning, of the intended buffer.

▼ Extended Description

Typically, this can result in corruption of data, a crash, or code execution. The product may modify an index or perform pointer arithmetic that references a memory location that is outside of the boundaries of the buffer. A subsequent write operation then produces undefined or unexpected results.

▼ Alternate Terms

Memory Corruption: Often used to describe the consequences of writing to memory outside the bounds of a buffer, or to memory that is invalid, when the root cause is something other than a sequential copy of excessive data from a fixed starting location. This may include issues such as incorrect pointer arithmetic, accessing invalid pointers due to incomplete initialization or memory release, etc.

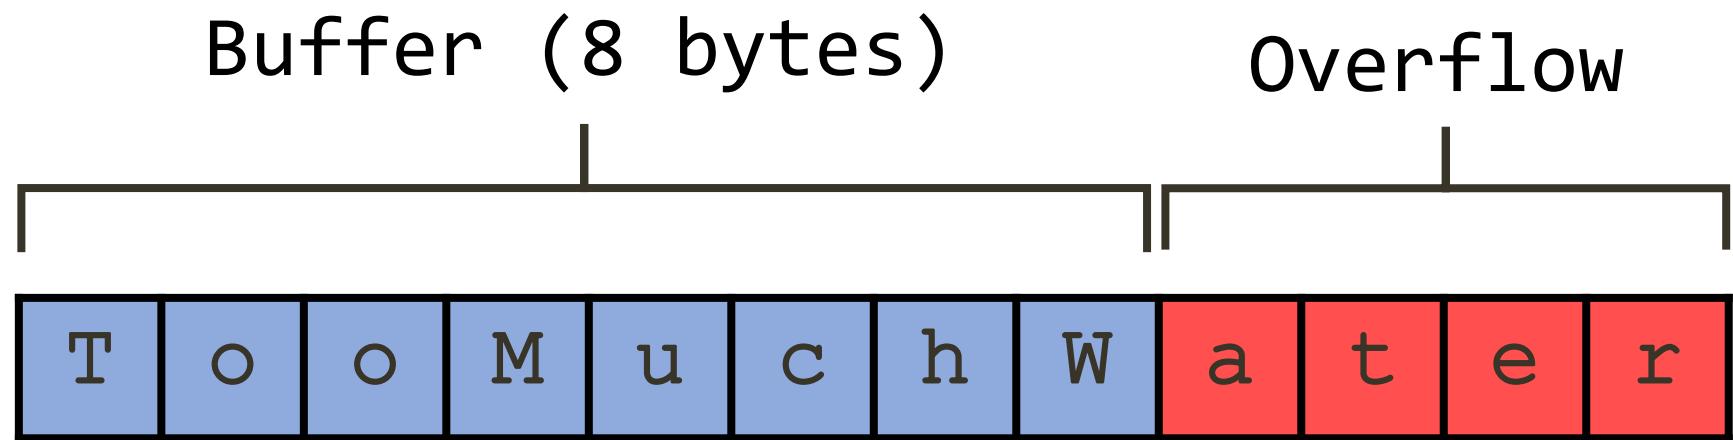

▼ Relationships

ⓘ ▼ Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name
ChildOf	ⓘ	119	Improper Restriction of Operations within the Bounds of a Memory Buffer
ParentOf	ⓘ	121	Stack-based Buffer Overflow
ParentOf	ⓘ	122	Heap-based Buffer Overflow
ParentOf	ⓘ	123	Write-what-where Condition
ParentOf	ⓘ	124	Buffer Underwrite ('Buffer Underflow')
CanFollow	ⓘ	822	Untrusted Pointer Dereference
CanFollow	ⓘ	823	Use of Out-of-range Pointer Offset
CanFollow	ⓘ	824	Access of Uninitialized Pointer
CanFollow	ⓘ	825	Expired Pointer Dereference

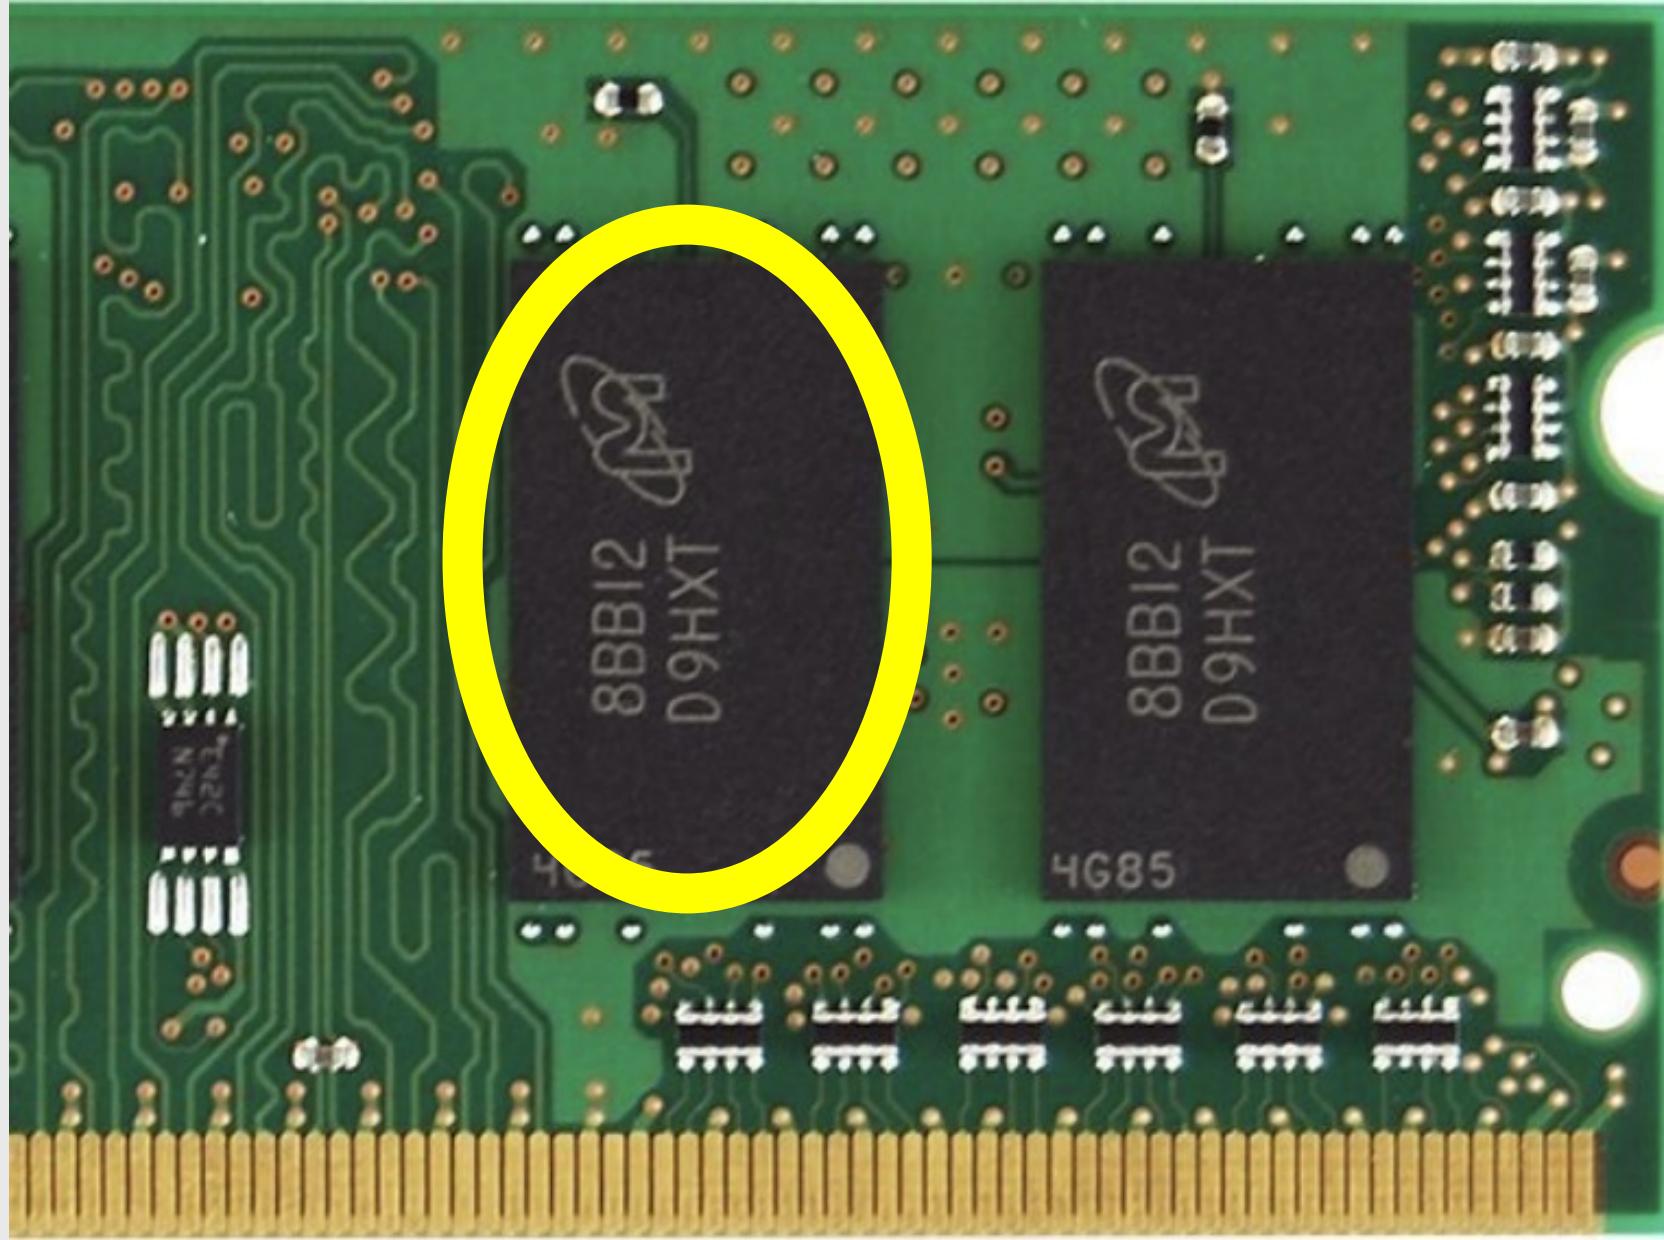

What is a buffer overflow?

More bytes are written to a buffer than allocated for it

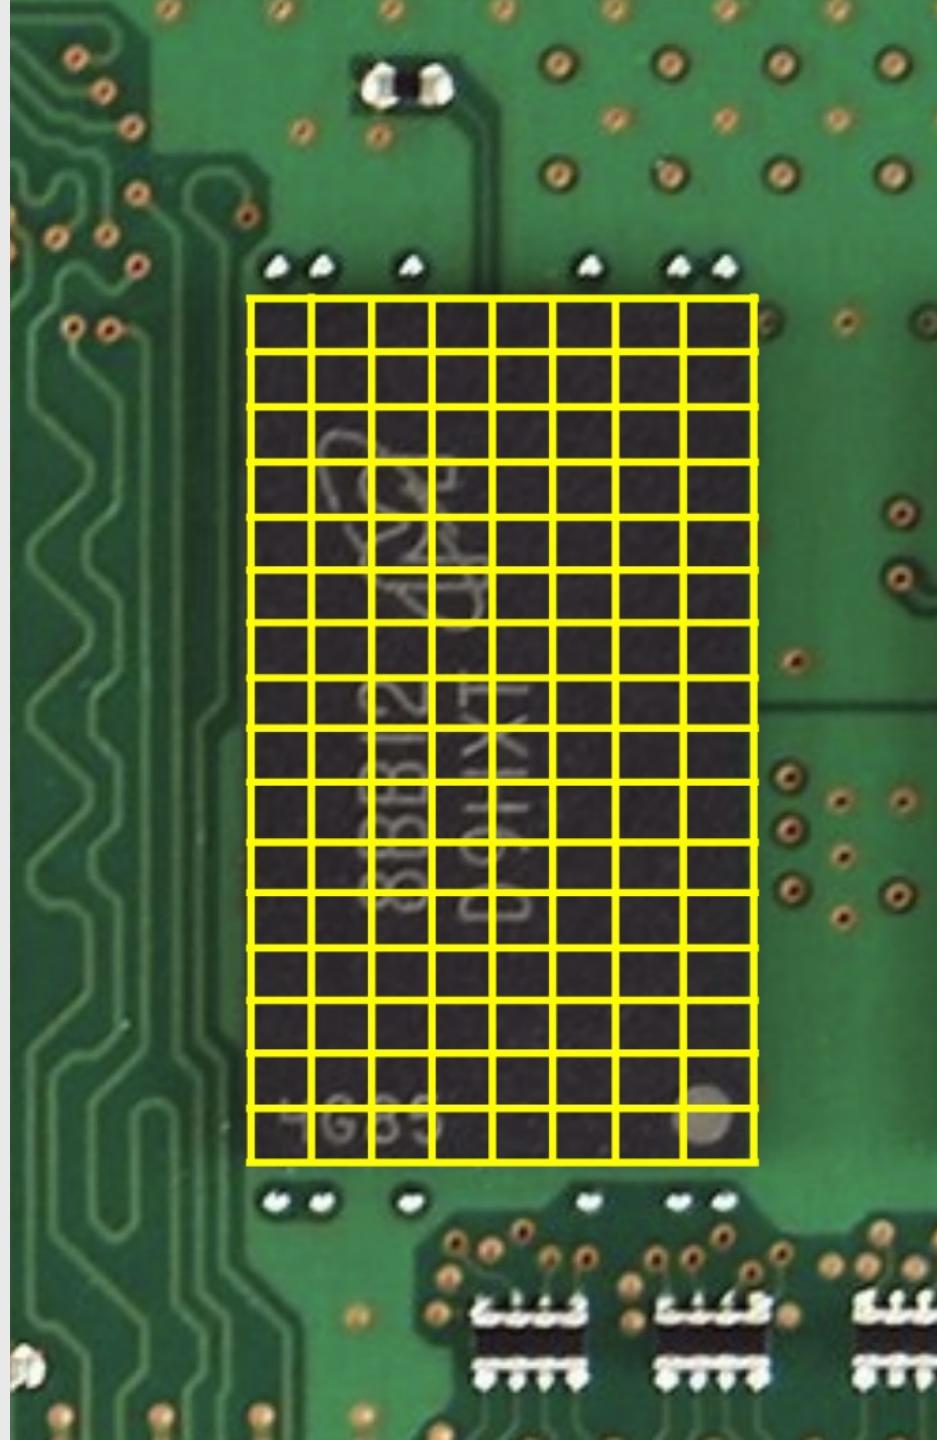

Software Vulnerabilities

Memory Layout

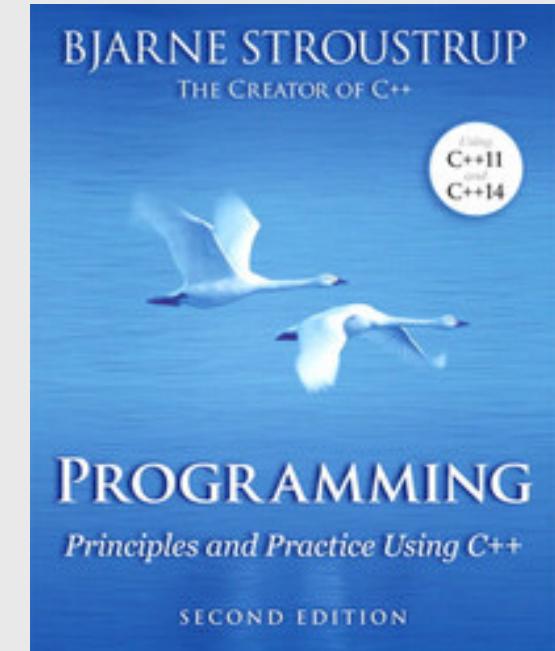

Memory Layout

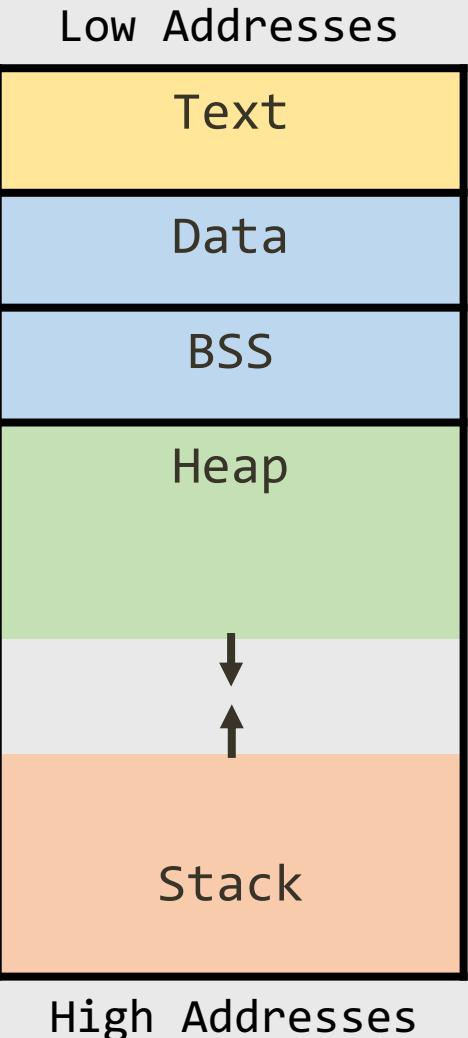

Memory Layout

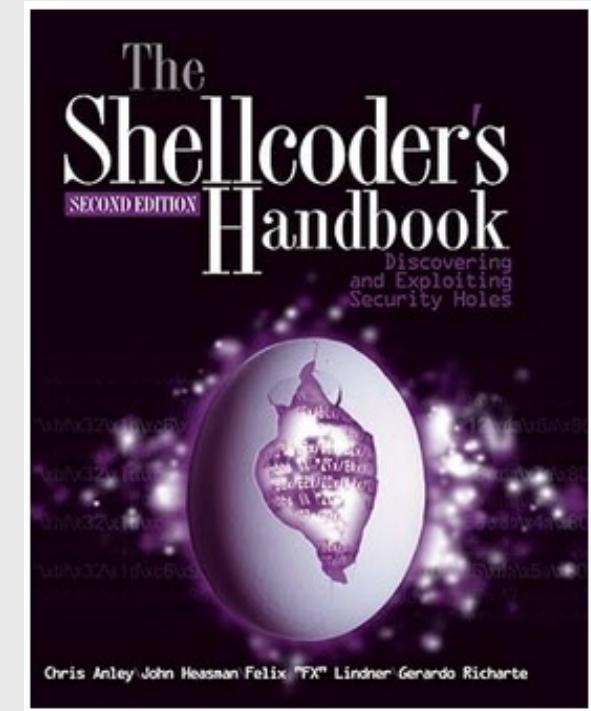

memory layout:

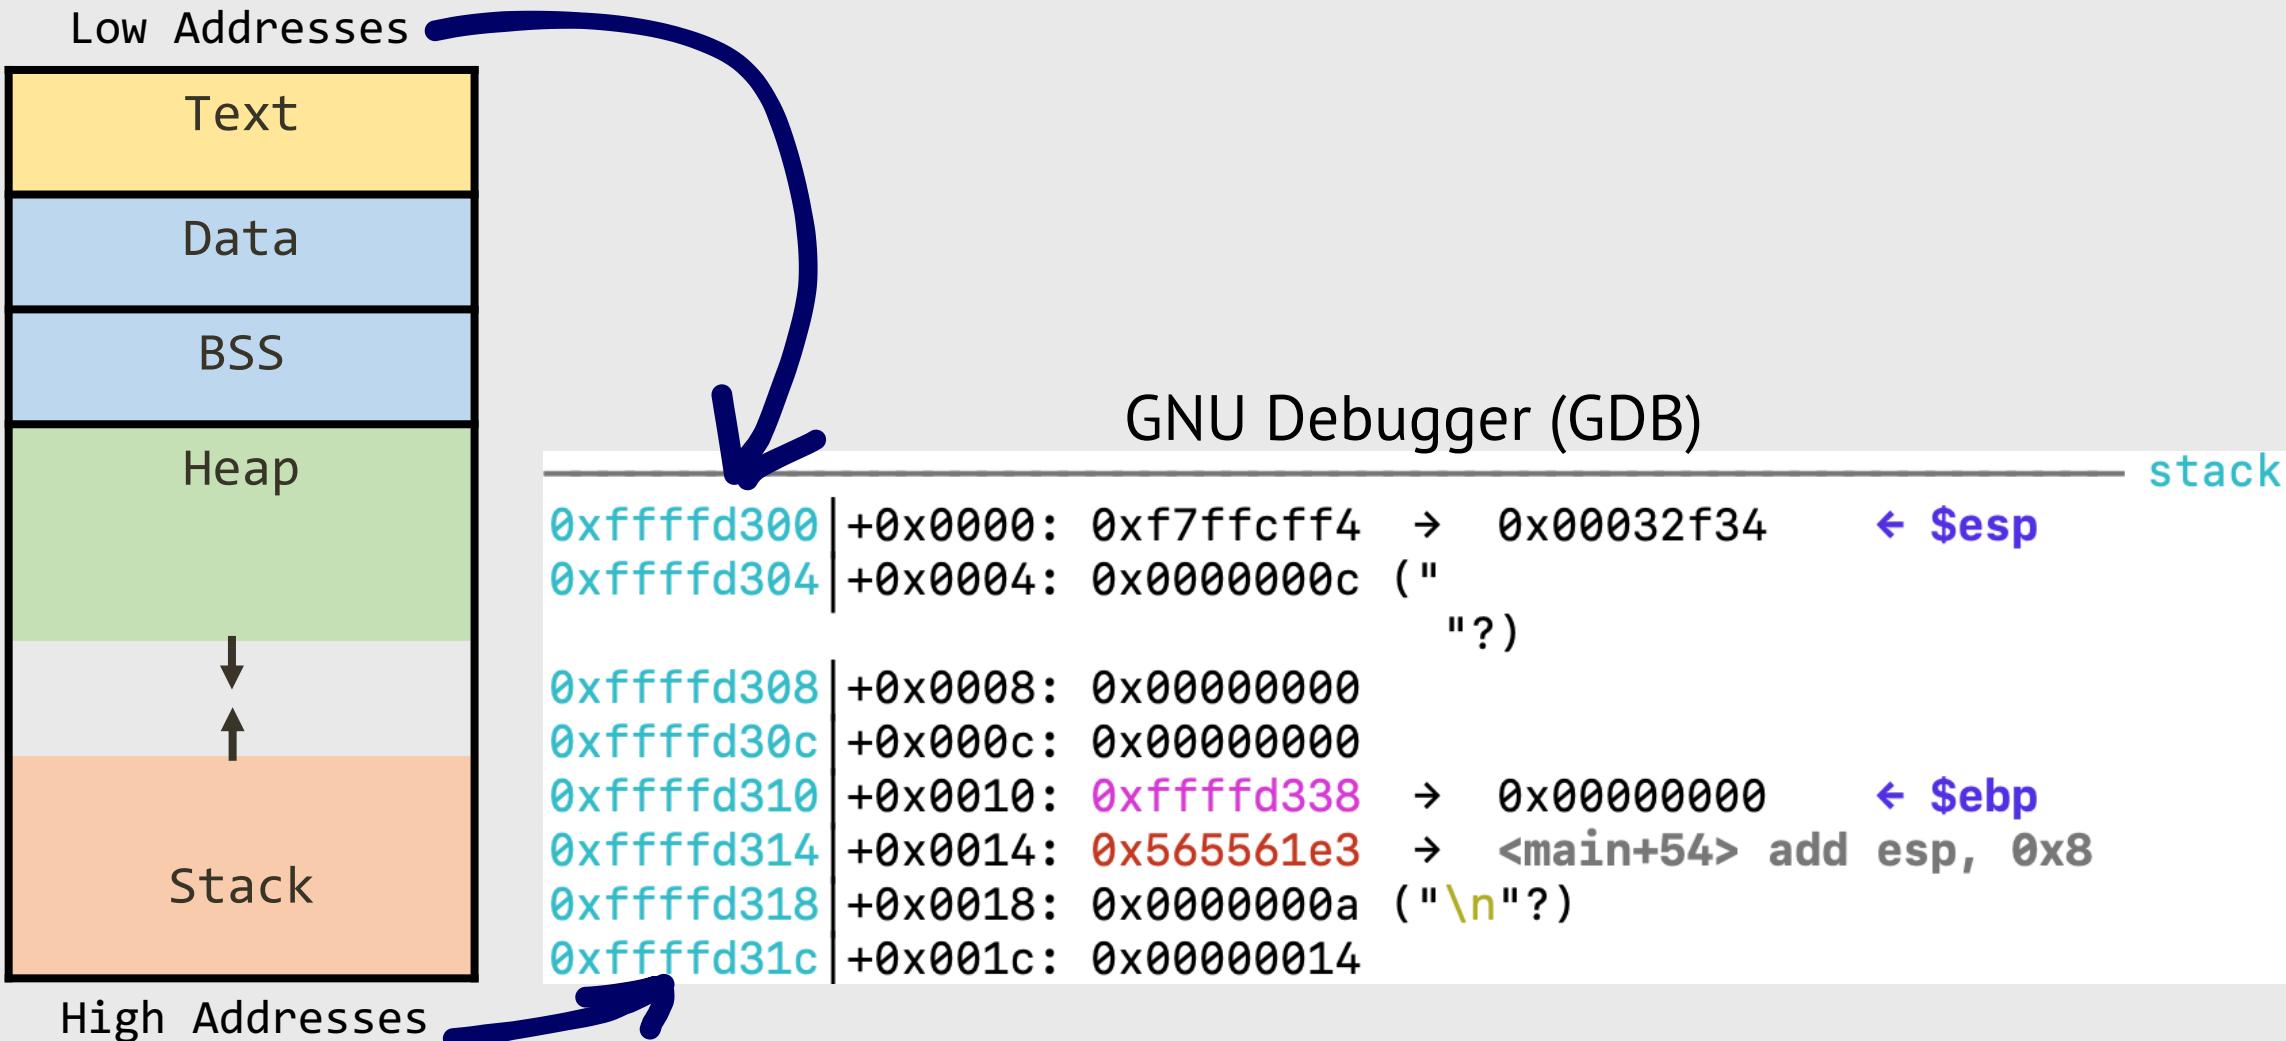

Memory Layout

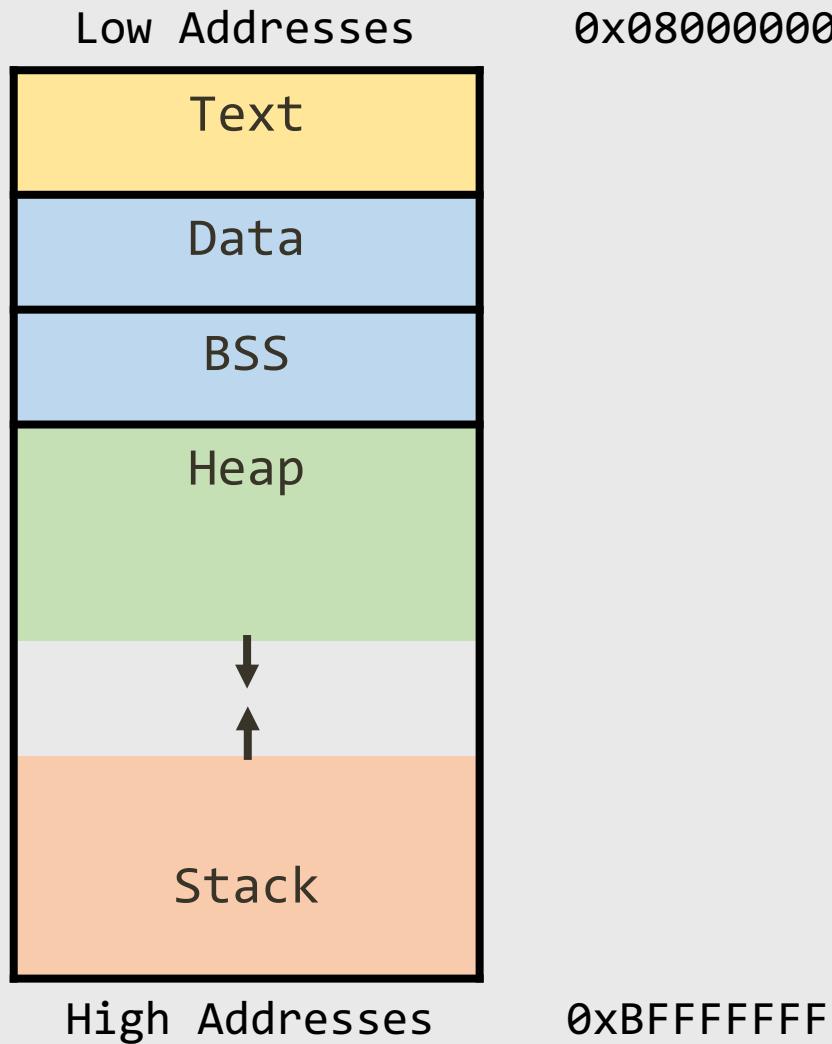

↑ Lower addresses (0x08000000)
Shared libraries
.text
.bss
Heap (grows ↓)
Stack (grows ↑)
env pointer
Argc
↓ Higher addresses (0xbfffffff)

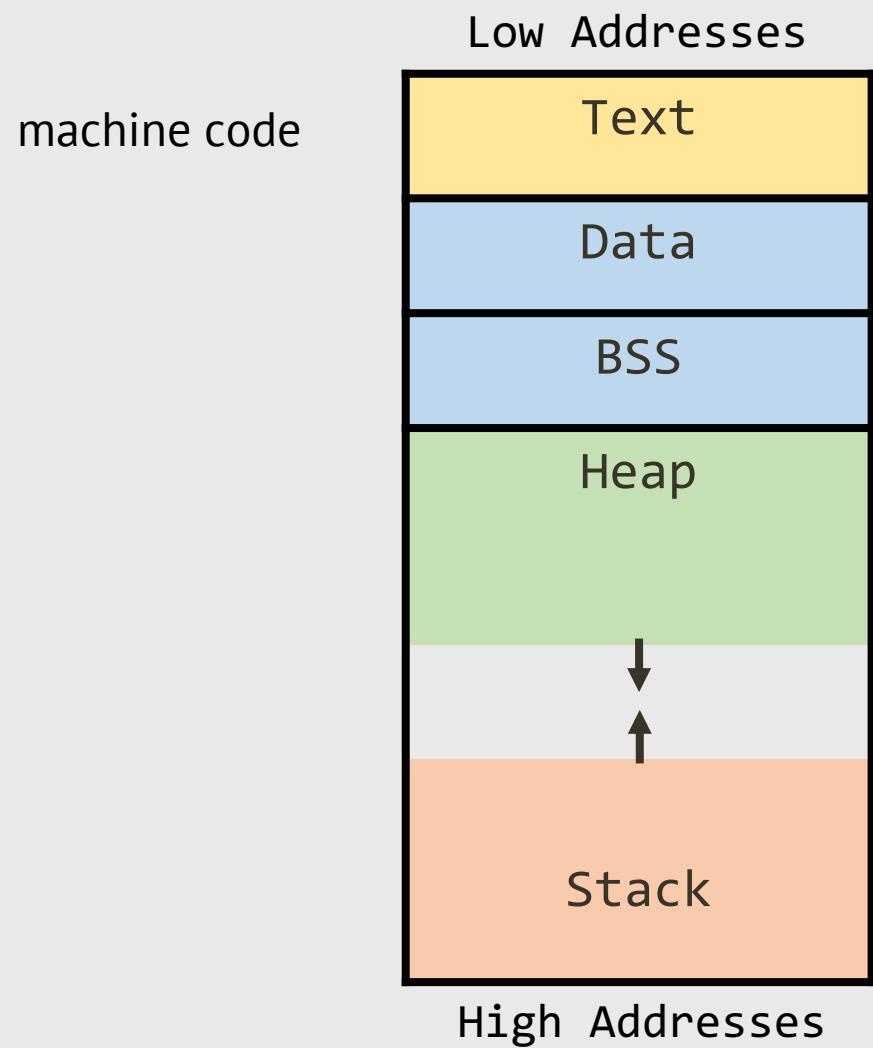

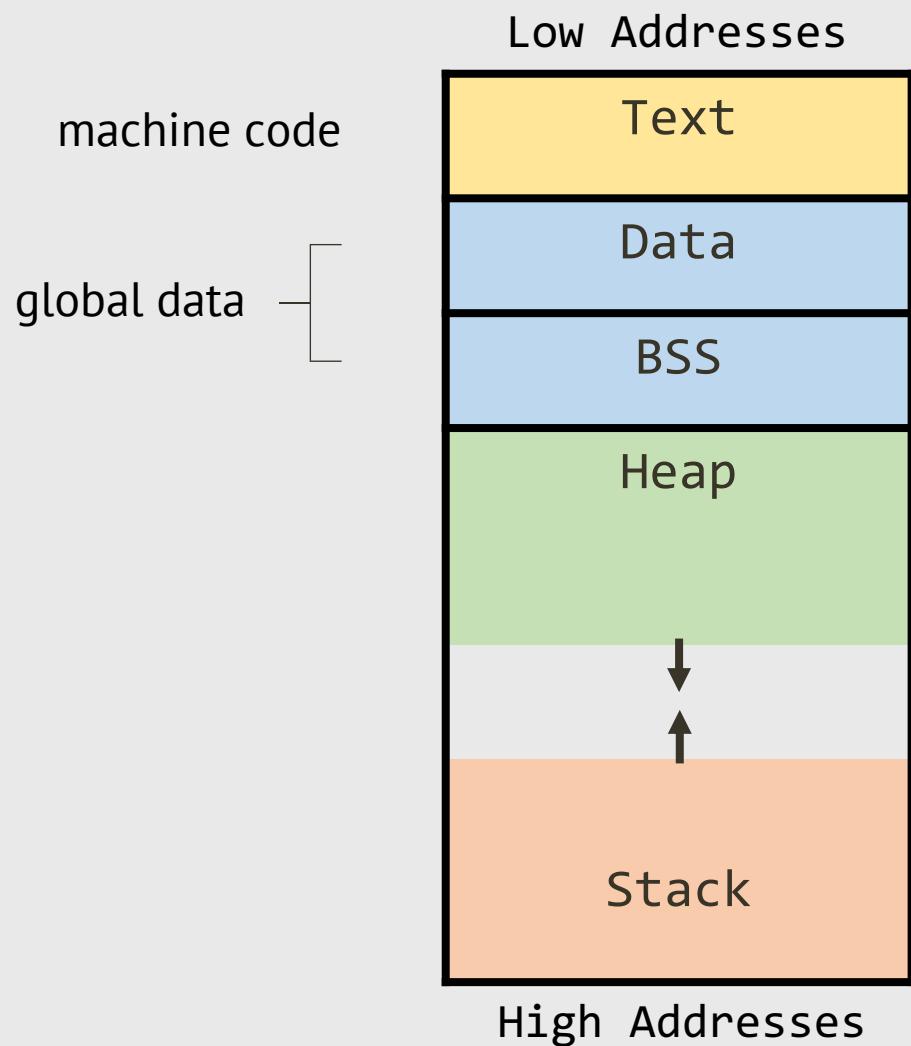

Memory Layout

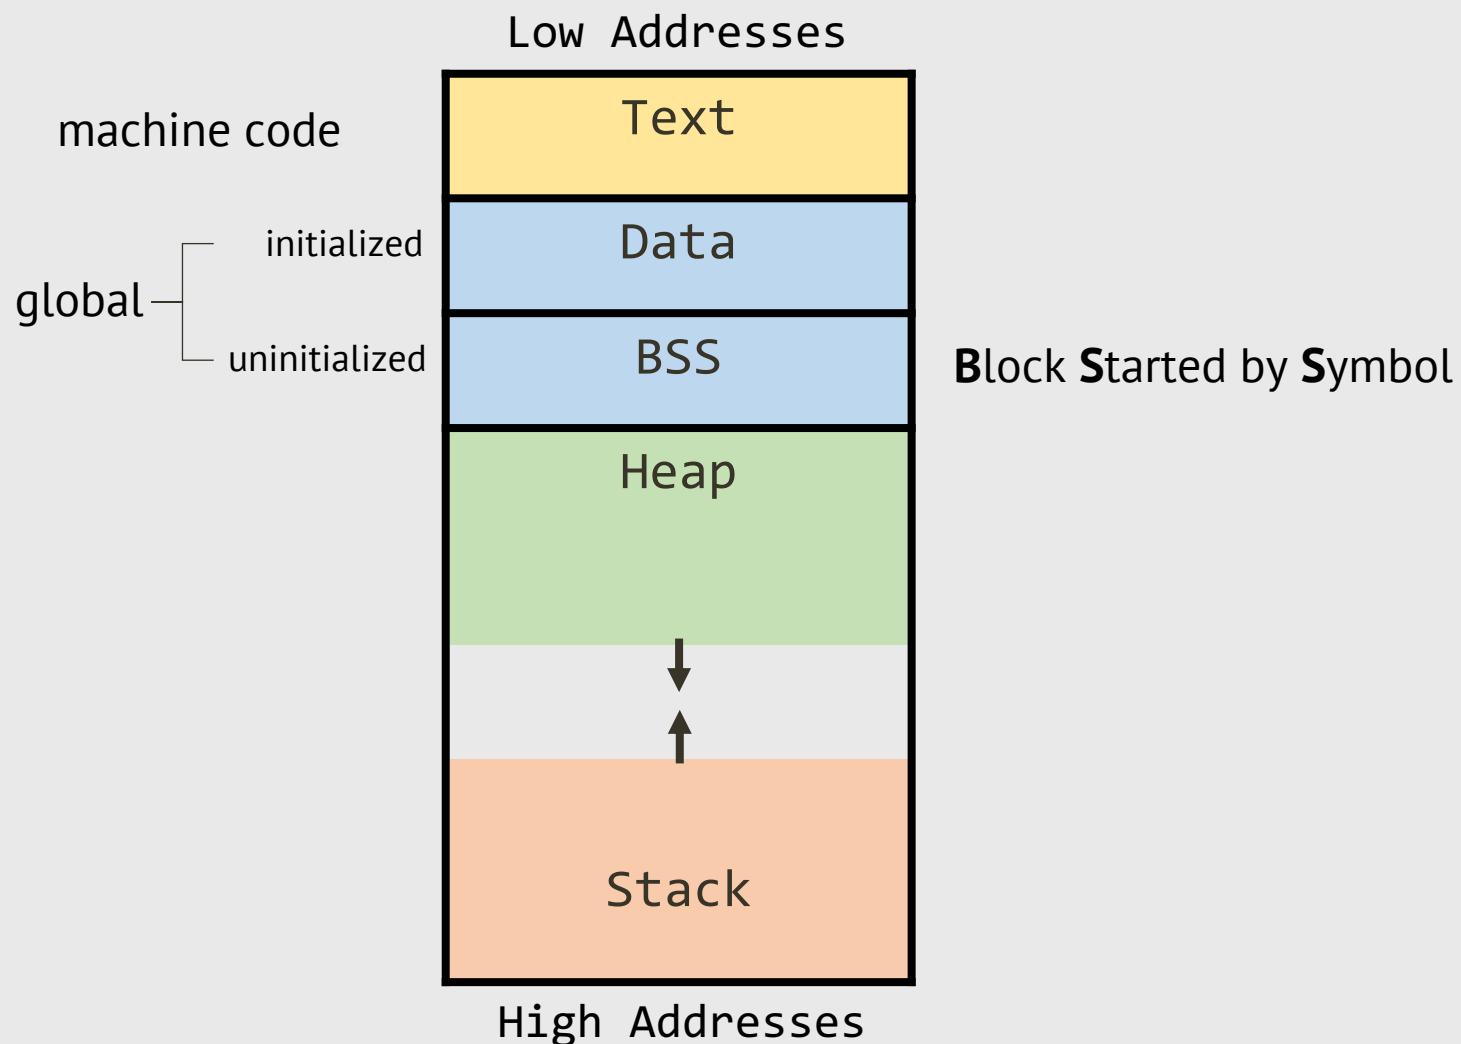

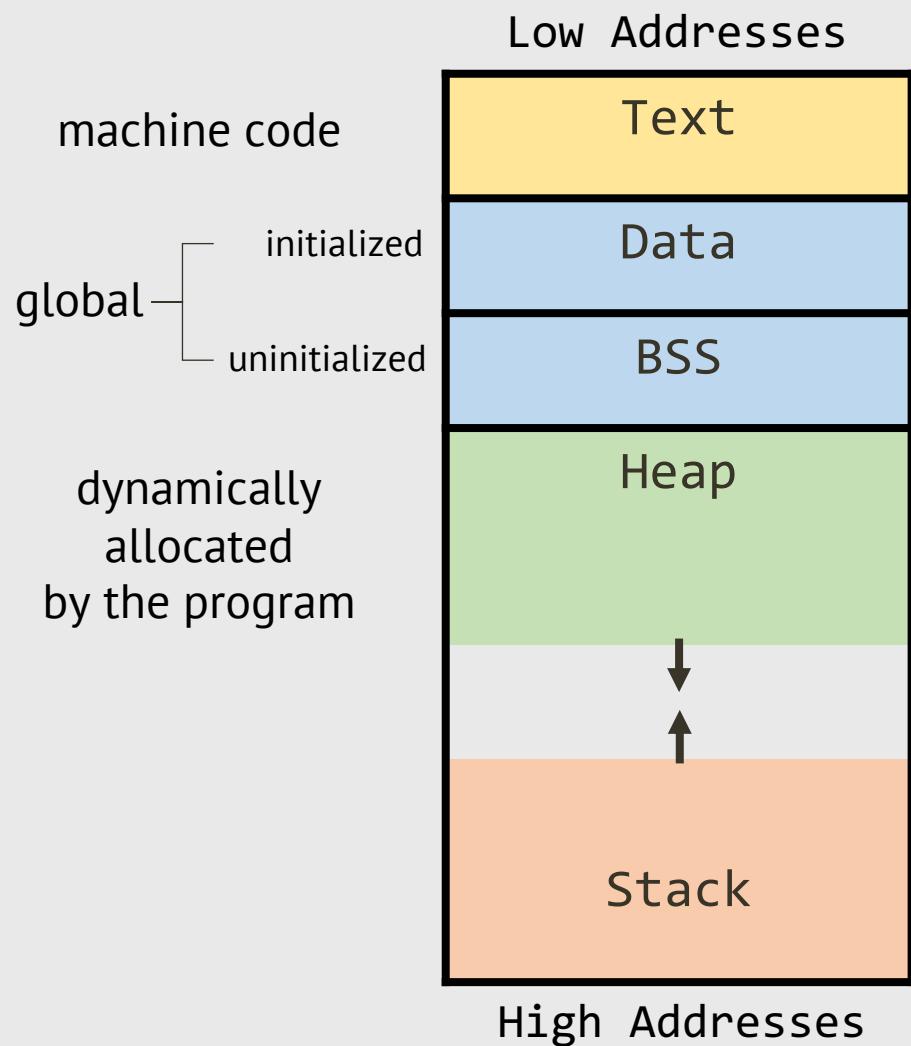

Memory Layout

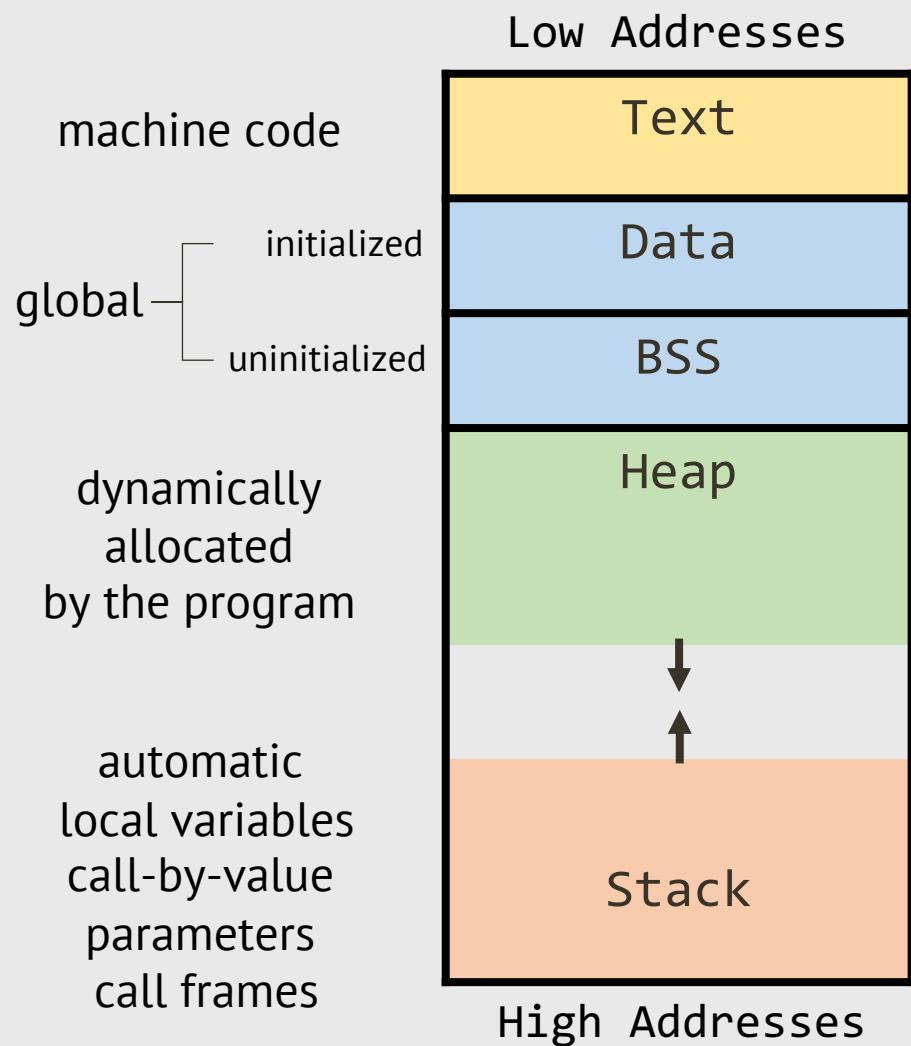

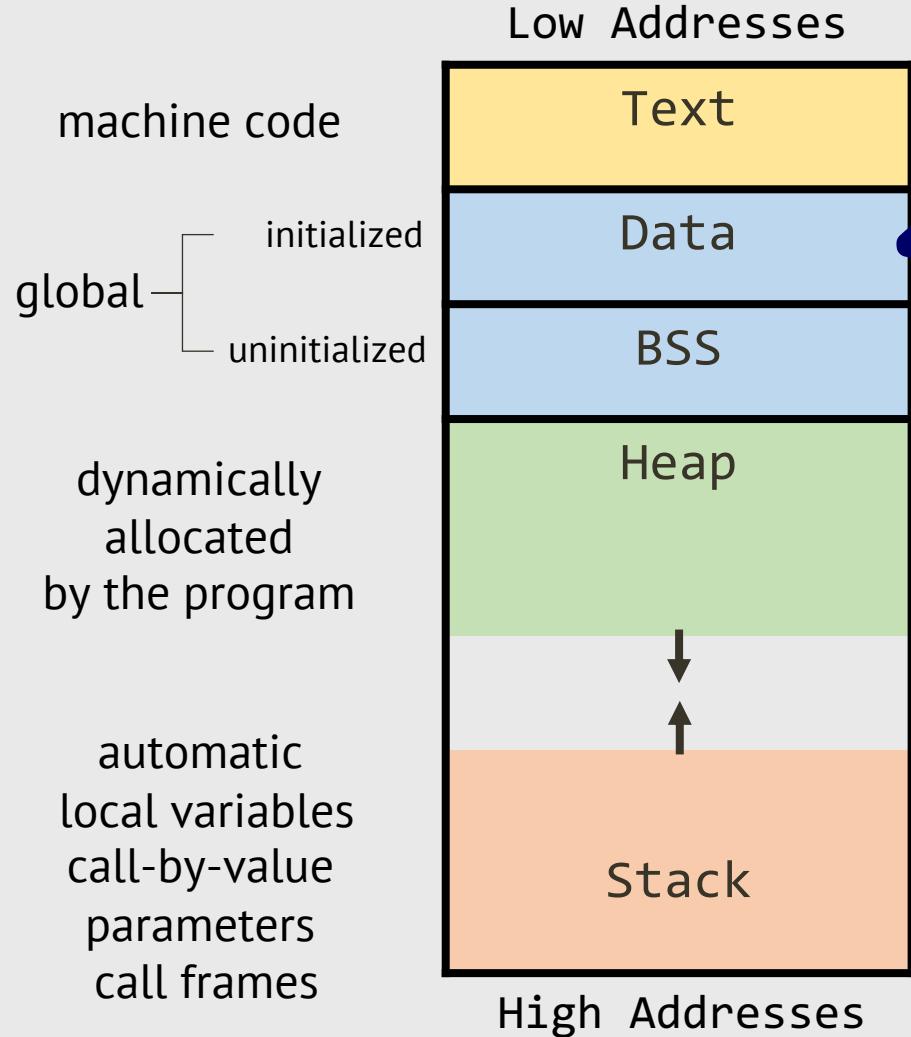

```

int x = 100;      // Initialized Global Variable.
int y;           // Uninitialized

int main()
{
    // Data stored on the stack in the main stack frame.
    int a = 2;
    float b = 2.5;

    // Allocate memory on the heap. malloc(2 * sizeof(int))
    int* ptr = new int[2];

    // Values store on heap.
    ptr[0] = 5;
    ptr[1] = 6;

    delete[] ptr; // free(ptr)

    return 1;
}

```

```

int x = 100;      // Initialized Global Variable.
int y;           // Uninitialized

int main()
{
    // Data stored on the stack in the main stack frame.
    int a = 2;
    float b = 2.5;

    // Allocate memory on the heap. malloc(2 * sizeof(int))
    int* ptr = new int[2];

    // Values store on heap.
    ptr[0] = 5;
    ptr[1] = 6;

    delete[] ptr; // free(ptr)

    return 1;
}

```

```

int x = 100;      // Initialized Global Variable.
int y;           // Uninitialized

int main()
{
    // Data stored on the stack in the main stack frame.
    int a = 2;
    float b = 2.5;

    // Allocate memory on the heap. malloc(2 * sizeof(int))
    int* ptr = new int[2];

    // Values store on heap.
    ptr[0] = 5;
    ptr[1] = 6;

    delete[] ptr; // free(ptr)

    return 1;
}

```

```

int x = 100;      // Initialized Global Variable.
int y;           // Uninitialized

int main()
{
    // Data stored on the stack in the main stack frame.
    int a = 2;
    float b = 2.5;

    // Allocate memory on the heap. malloc(2 * sizeof(int))
    int* ptr = new int[2];

    // Values store on heap.
    ptr[0] = 5;
    ptr[1] = 6;

    delete[] ptr; // free(ptr)

    return 1;
}

```

```

int x = 100;      // Initialized Global Variable.
int y;           // Uninitialized

int main()
{
    // Data stored on the stack in the main stack frame.
    int a = 2;
    float b = 2.5;

    // Allocate memory on the heap. malloc(2 * sizeof(int))
    int* ptr = new int[2];

    // Values store on heap.
    ptr[0] = 5;
    ptr[1] = 6;

    delete[] ptr; // free(ptr)

    return 1;
}

```

Draw lines from variables to memory:

```
int totalLogins = 0;
int sessionCount;

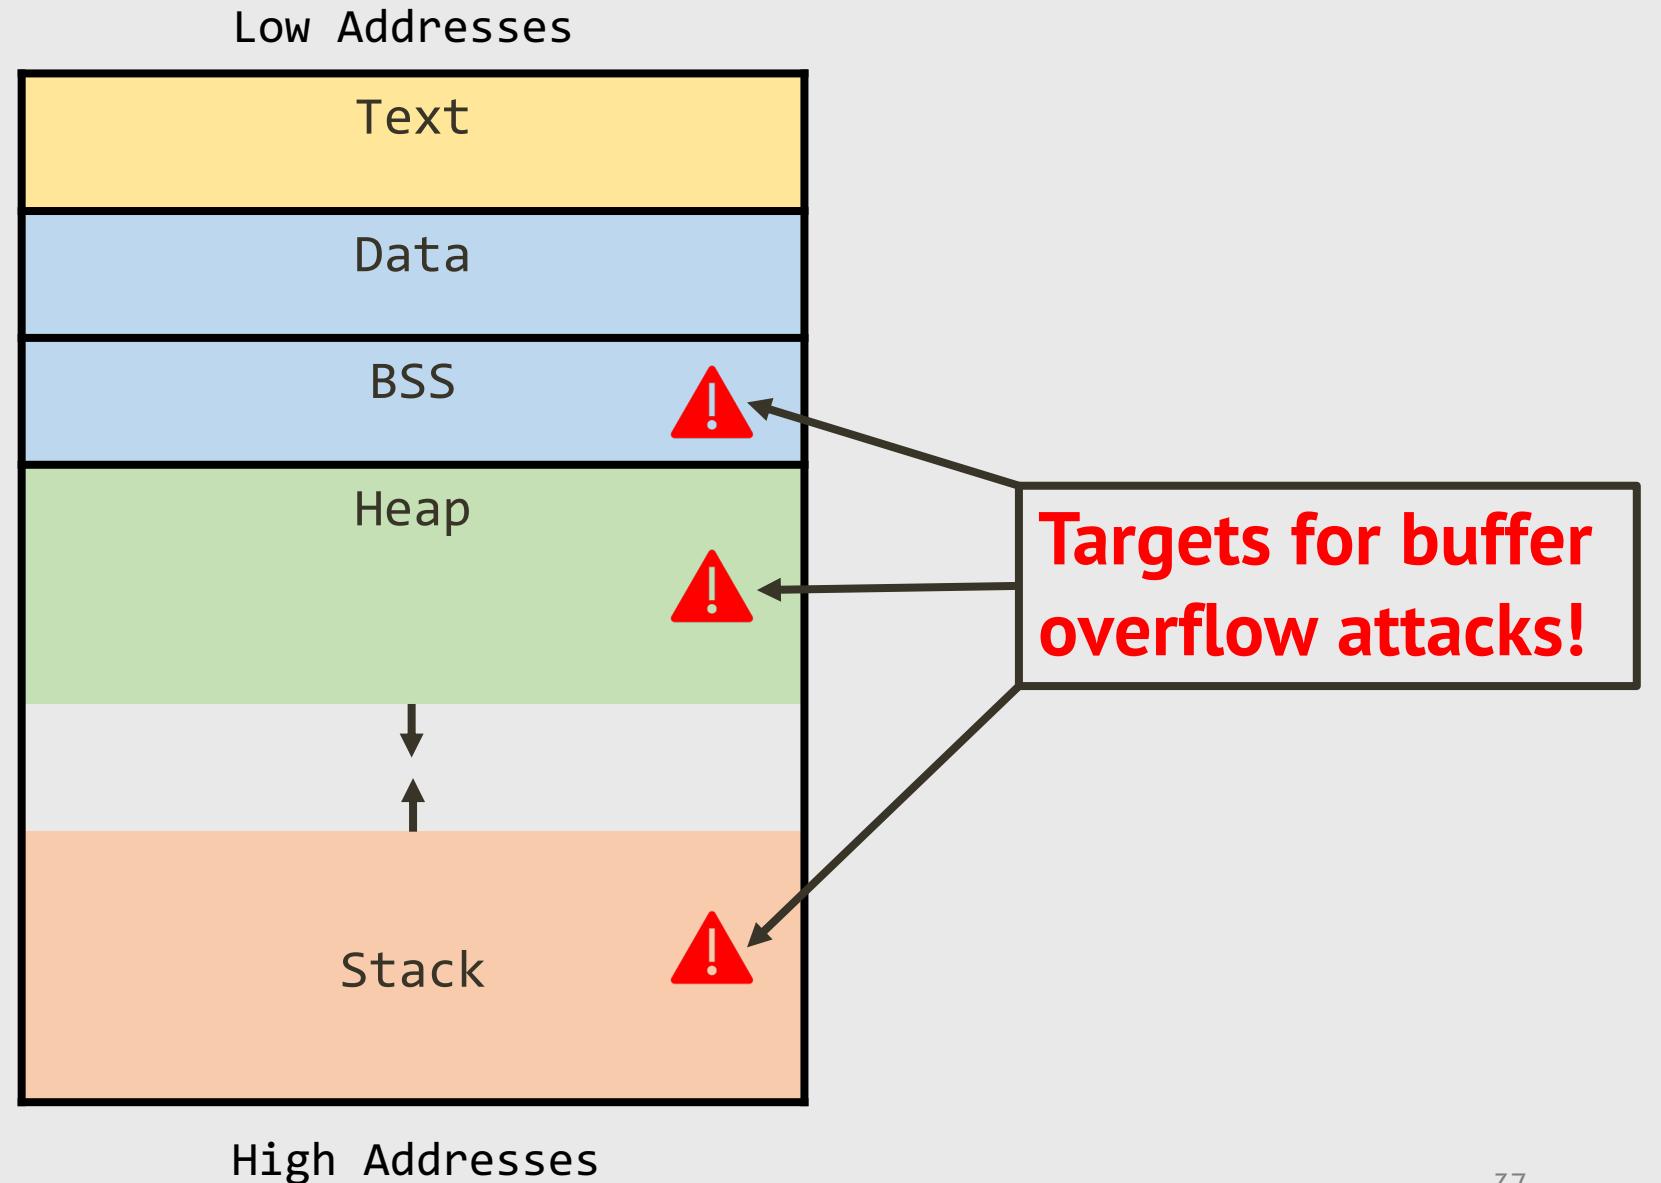

void loginUser(string username)
{
    char* sessionToken = new char[30];

    if(sessionToken != NULL)
    {
        cout << username << " logged in" << endl;
        sessionCount++;
        totalLogins++;
    }

    delete[] sessionToken;
}

int main()
{
    string username = "Alice";

    loginUser(username);
    return 0;
}
```

2. Program memory layout
3. Stack layout
4. Buffer overflow vulnerability

Stack

Call Stack

- A **call stack** is a stack data structure that stores information about the active functions of a computer program
- A call stack is composed of **stack frames**
- A stack frame is a data structure used to store information about each function call

Call Stack

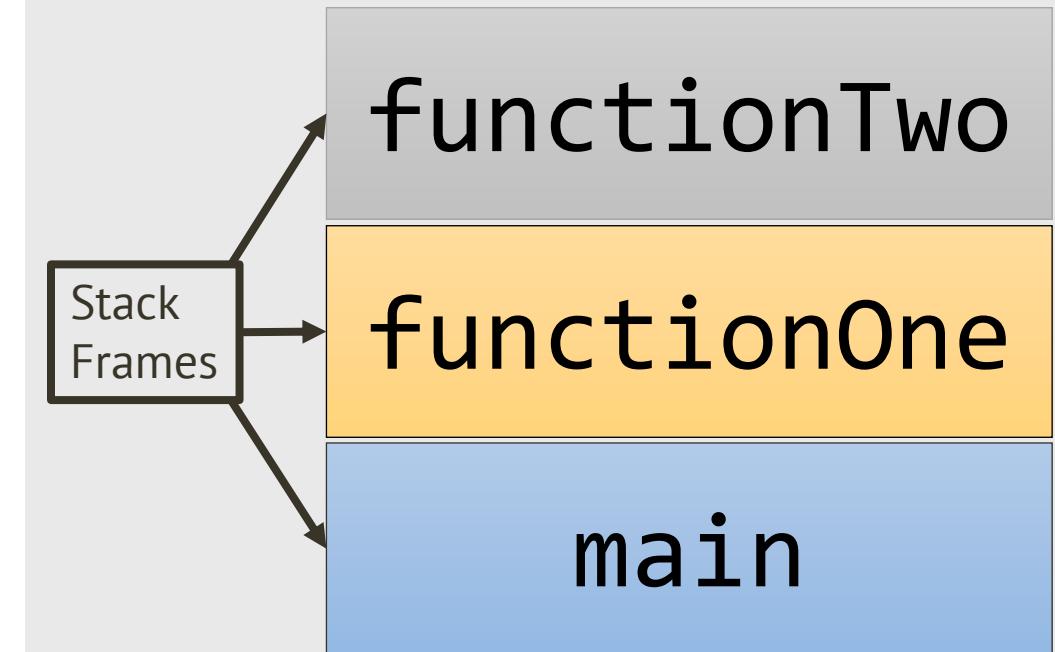

```
void functionTwo()
{
    printf("In function two");
}

void functionOne()
{
    printf("In function one");

    functionTwo(); // Call function Two
}

int main()
{
    functionOne(); // Call function One

    return 0;
}
```

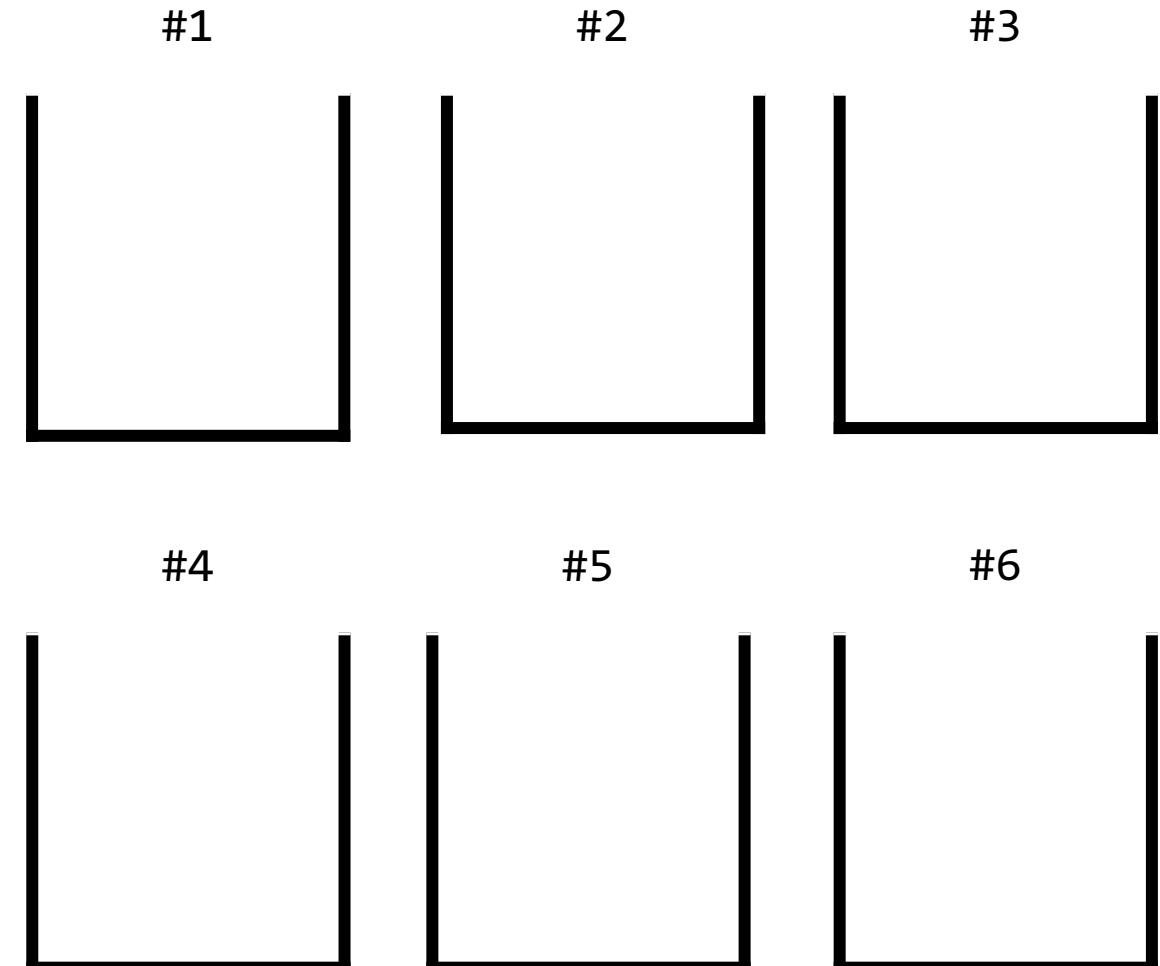

```
int getOne()
{
    int one = 1;           // CALL STACK #3
    return one;
}
```

```
int getTwo()
{
    int two = 2;          // CALL STACK #4
    return 2;
}
```

```
int addOneTwo()
{
    int one = getOne();    // CALL STACK #2
    int two = getTwo();
    return one + two;     // CALL STACK #5
}
```

```
int main()
{
    double pi = 3.14159;   // CALL STACK #1
    int result = addOneTwo();
    return 0;              // CALL STACK #6
}
```

Draw the state of all six call stacks:

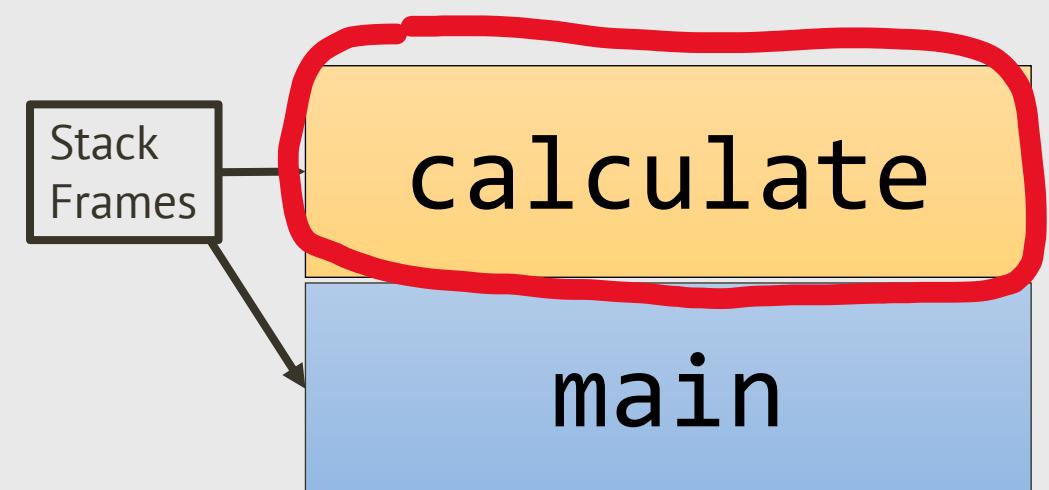

Call Stack

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}

int main()
{
    int result = calculate(10, 20);
    return 0;
}
```

Stack Frame

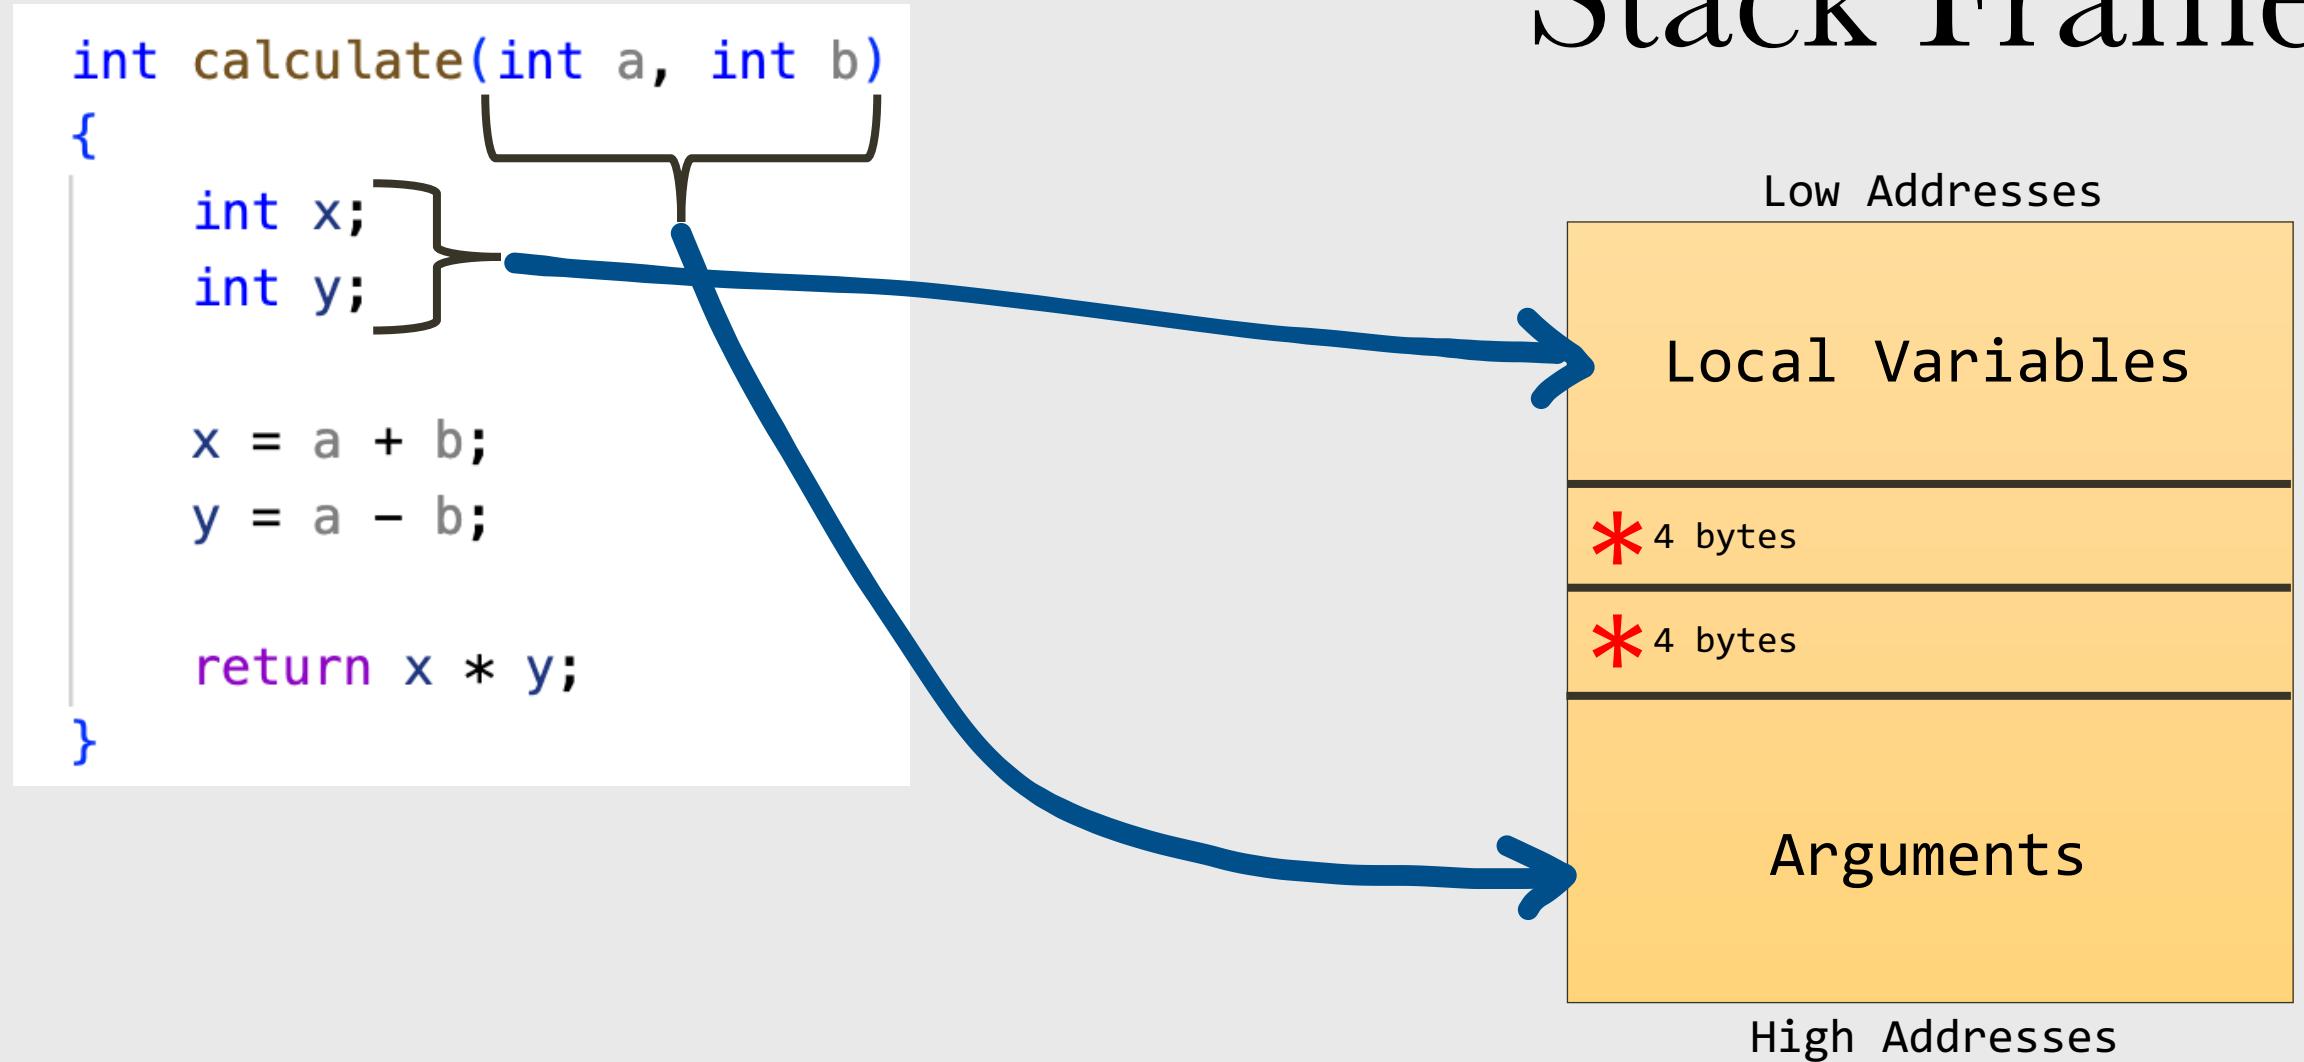

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}
```

calculate

Stack Frame

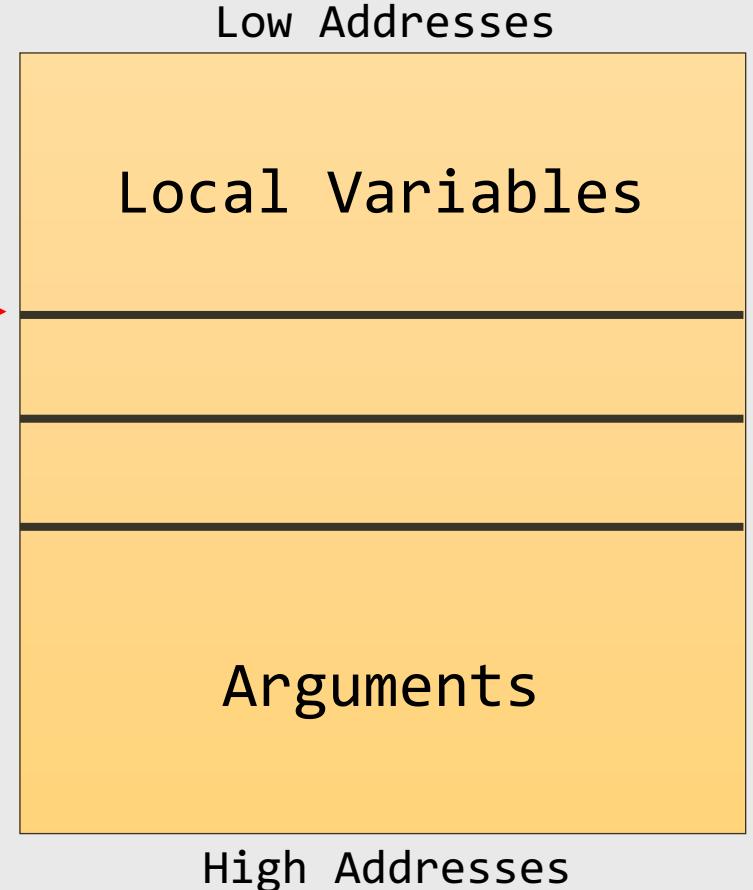

Stack Frame

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}
```

Frame Pointer (ebp) →

In the x86 architecture the frame pointer is stored in a special register called **ebp**

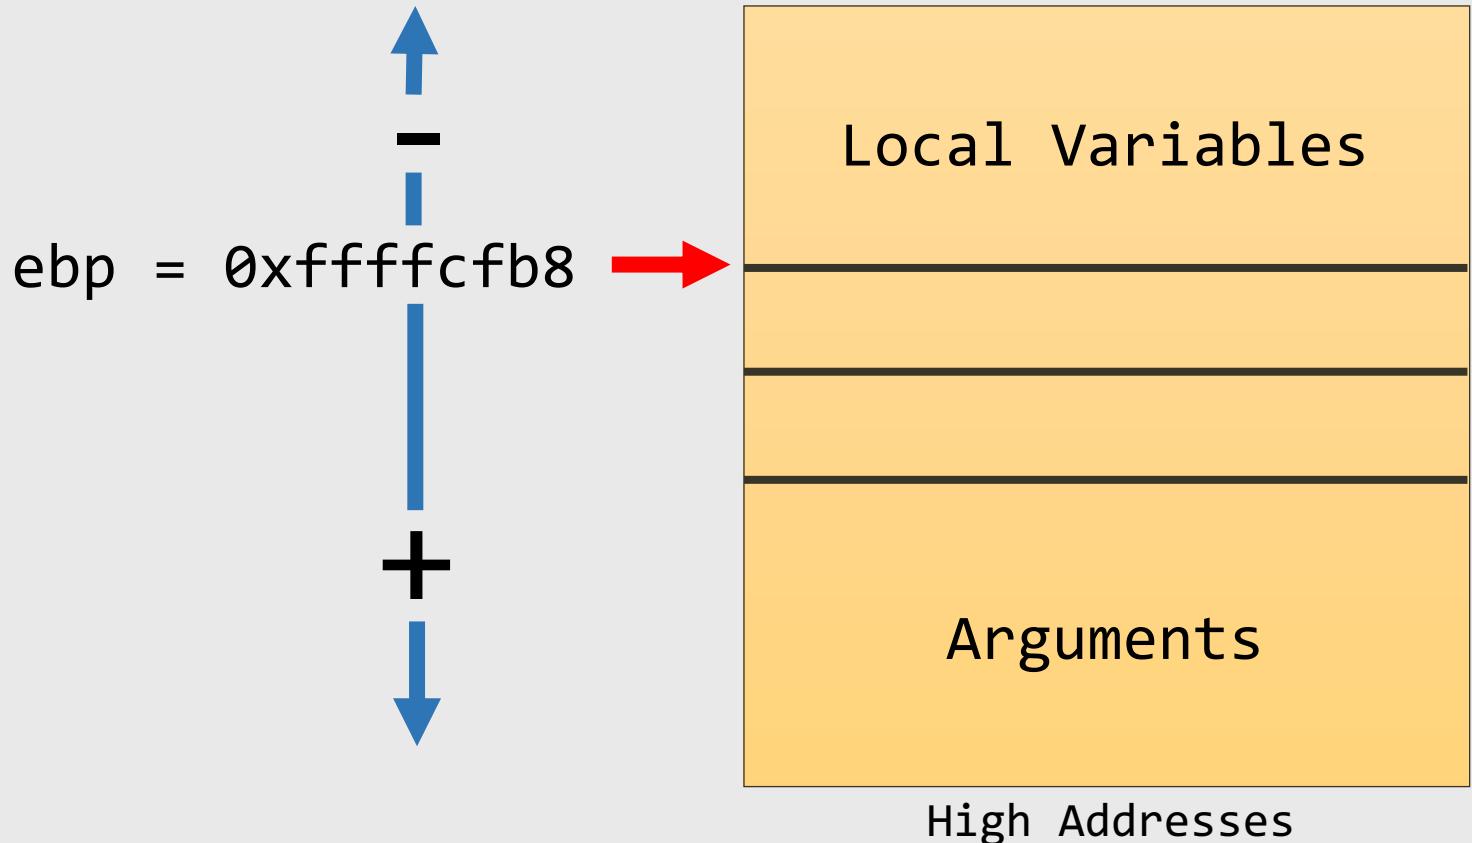

How do we know the addresses of the local variables and arguments?

Stack Frame

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}
```

We can add and subtract from the **frame pointer**

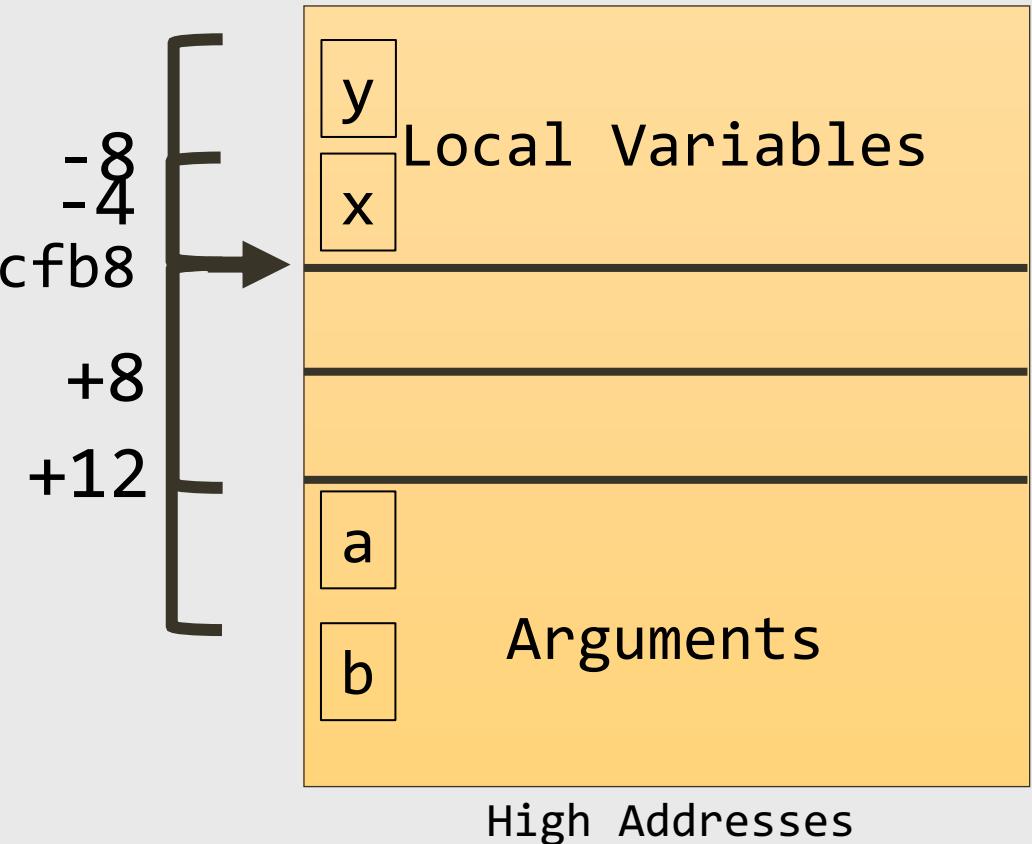

Stack Frame

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}
```

ebp = 0xffffcfb8

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}
```

Stack Frame

ebp = 0xffffcfb8

-4
+8
+12

mov edx, DWORD PTR [ebp+0x8]
mov eax, DWORD PTR [ebp+0xc]
add eax, edx
mov DWORD PTR [ebp-0x4], eax

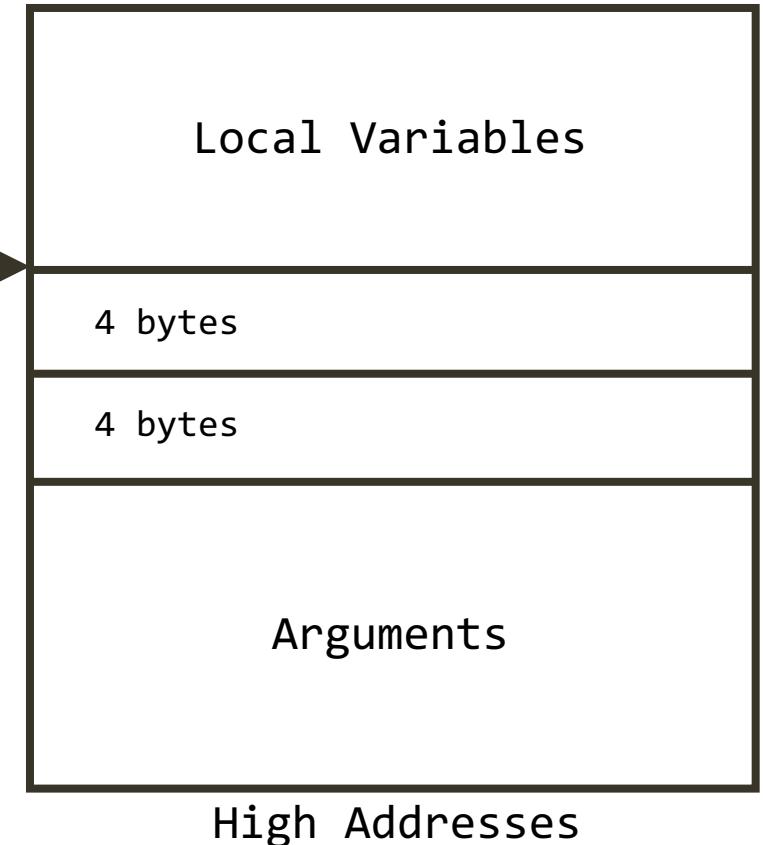

Write in the location of variables and arguments in the **stack frame**:

```
int multiplier(int a, int b, int c)
{
    int x = 22;
    int y = 15;
    int z = 39;

    return (a * x) + (b * y) + (c * z);
}
```

ebp = 0xffffcfb8 →

Write the distance in bytes from the **frame pointer (ebp)**:

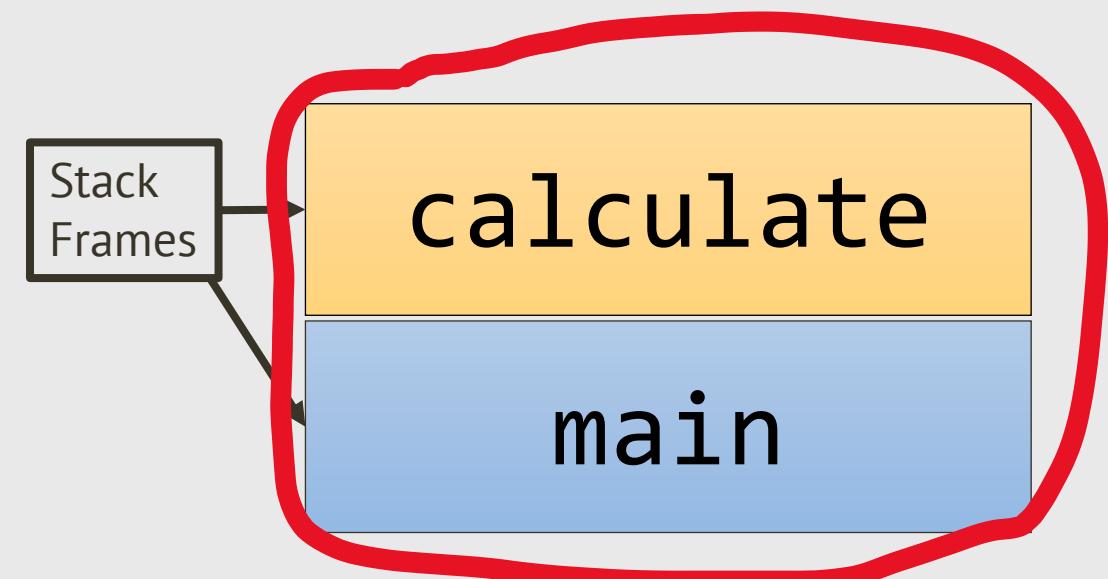

Call Stack

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}

int main()
{
    int result = calculate(10, 20);
    return 0;
}
```

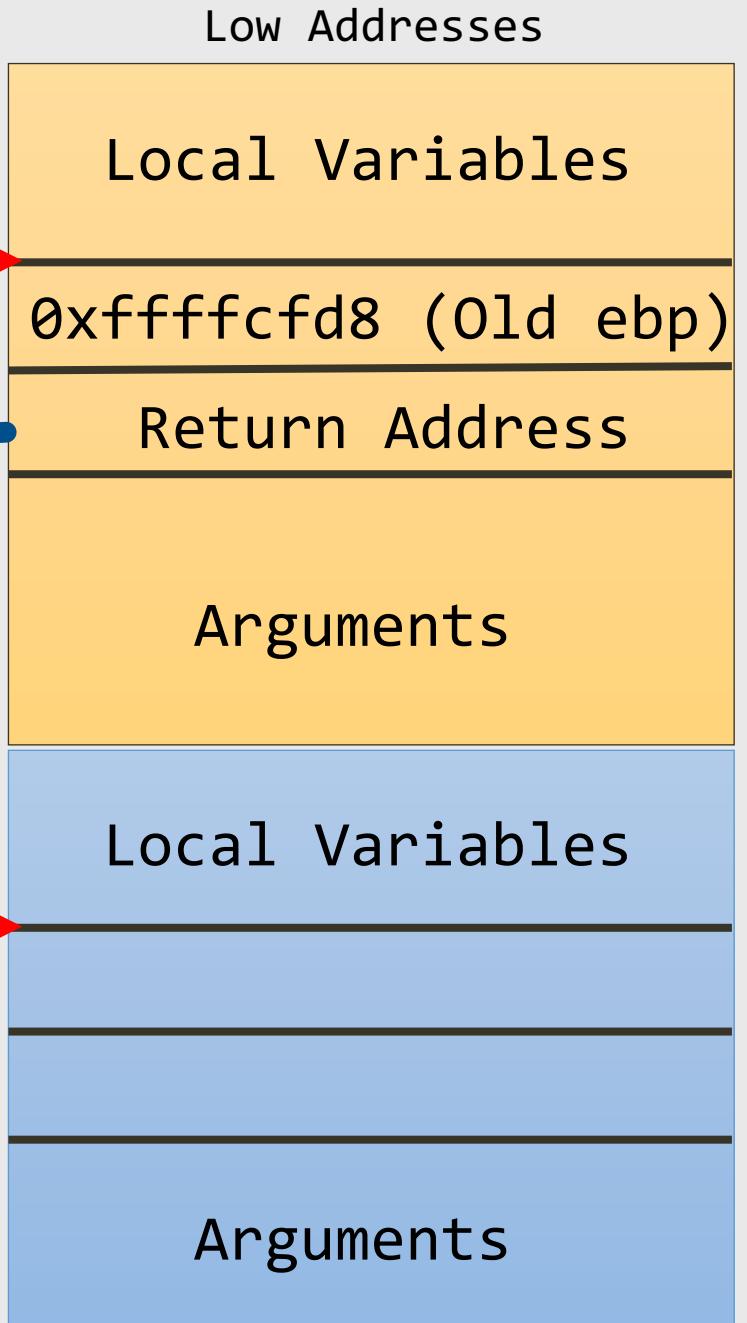

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}
```

```
int main()
{
    calculate(10, 20);
    return 0;
}
```

ebp = 0xffffcfb8

```
int calculate(int a, int b)
{
    int x;
    int y;

    x = a + b;
    y = a - b;

    return x * y;
}
```

```
int main()
{
    calculate(10, 20);
    return 0;
}
```

ebp = 0xffffcfb8

Return Address:
0x565561c3

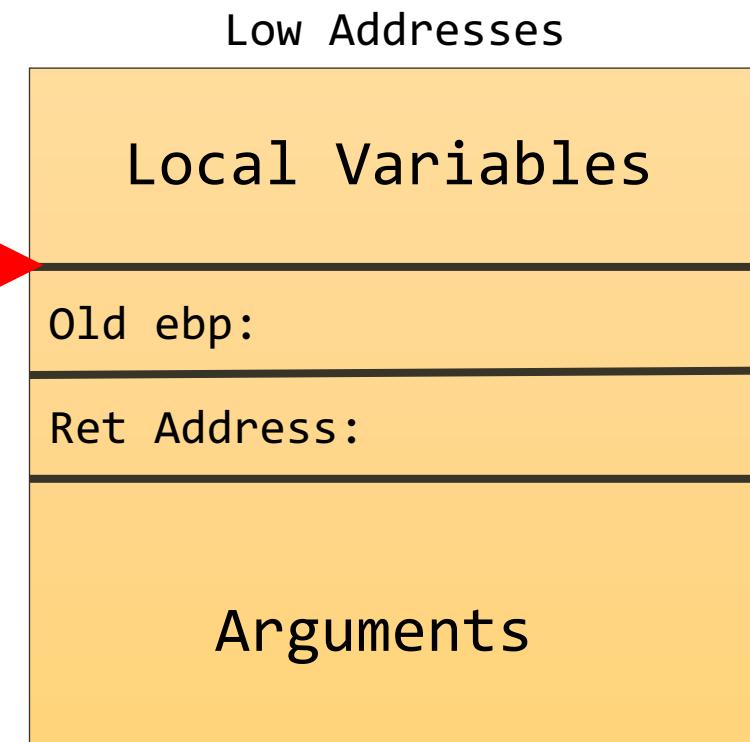

Write in the **return address** and old **ebp**:

```
int multiplier(int a, int b, int c)
{
    int x = 22;
    int y = 15;
    int z = 39;

    return (a * x) + (b * y) + (c * z);
}
```

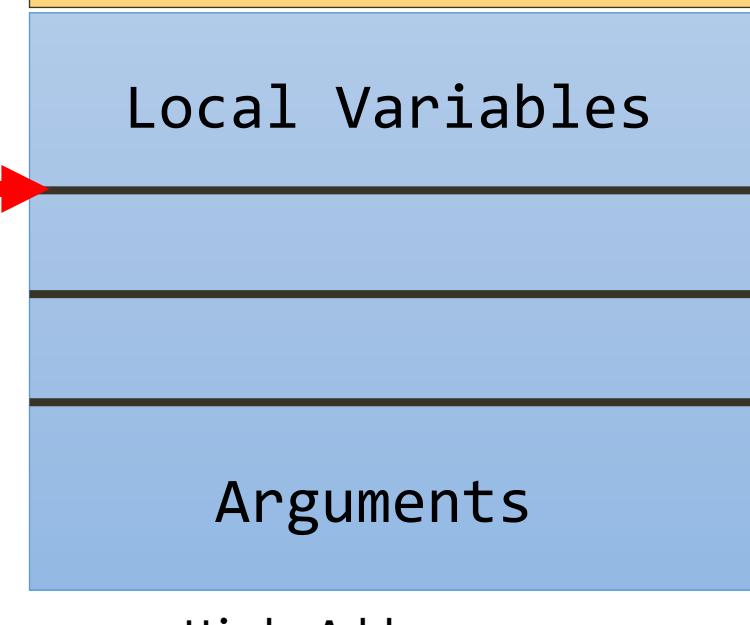

ebp = 0xffffcfb8

```
int main()
{
    int result = multiplier(10 , 20 , 30);
    return 0;
}
```

Main frame pointer = 0xffffcfb8

Return Address:
0x565561c3

Software Vulnerabilities

1. Introduction
2. Program memory layout
3. Stack layout
4. Buffer overflow vulnerability

```
void copyInputToBuffer(char* input)
{
    → char buffer[10];

    // Potential buffer overflow
    → strcpy(buffer, input);
}

int main()
{
    → printf("Enter a string: ");

    → char input[256];
    → fgets(input, sizeof(input), stdin);

    → copyInputToBuffer(input);

    return 0;
}
```

```
void copyInputToBuffer(char* input)
```

```
{  
    char buffer[10];  
  
    // Potential buffer overflow  
    strcpy(buffer, input);  
}
```

```
int main()  
{  
    printf("Enter a string: ");  
  
    char input[256];  
    fgets(input, sizeof(input), stdin);  
  
    copyInputToBuffer(input);  
  
    return 0;  
}
```
